ARE YOU AT RISK OF FALLING?

In upstate New York **3 in 10** adults ages 65 and older fell at least once in the last year. **Could you be next?**

Timed Up and Go (TUG) Test

If you're age 65 or older, check your risk of falling by taking this test. The TUG Test evaluates basic mobility skills.

You'll need:	How to do it:
 A stopwatch or watch with a second hand	 A chair
 A family member or friend to assist you	 10 Feet

When your assistant says "Go":

- 1  Stand up from the chair
- 2  Walk to the line on the floor at your normal pace
- 3  Turn around
- 4  Walk back to the chair at your normal pace
- 5  Sit down again

Your assistant should start timing on the word "go" and stop timing after you sit back down. While you walk, your assistant should stand between the chair and the line to help you, if needed.

If you take 12 or more seconds to complete the TUG Test, you're generally at a higher risk of falling.

Falls can be prevented

but in upstate N.Y. only **2 out of 5** adults ages 65 and older have taken action to reduce their chance of falling.

Talk with your doctor about your risk of falling and how you can prevent falls. Your doctor may suggest these actions:

 Move more to improve balance and develop strength. ALL MOVEMENT MATTERS!	 Review medication	 Make your home safer by removing hazards and improving lighting	 Have regular vision checks
		 Wear proper footwear	

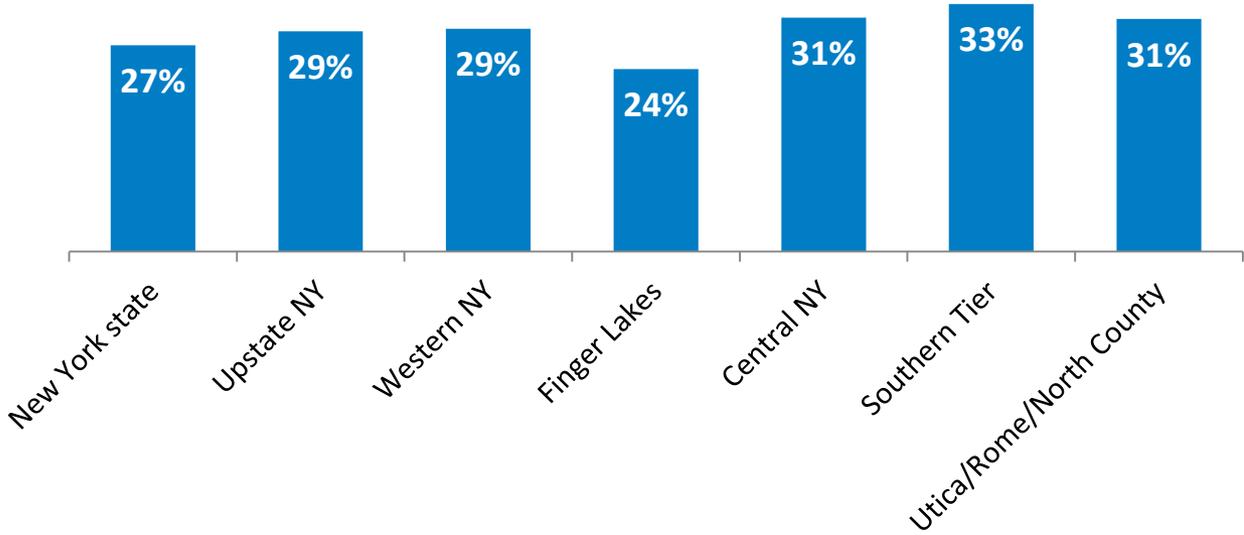

Background

Six in 10 upstate New York adults ages 65 and older report that they have not taken steps to reduce their risk of falling and three of 10 adults in the same age group fell at least once in the past year ([CDC](#)). However common, falling should not be an accepted part of the aging process.

An important part of fall prevention is understanding one's risk of falling. The purpose of this report is to suggest a tool for assessing fall risk and offer prevention strategies to reduce falls and improve the health of our community.
